“

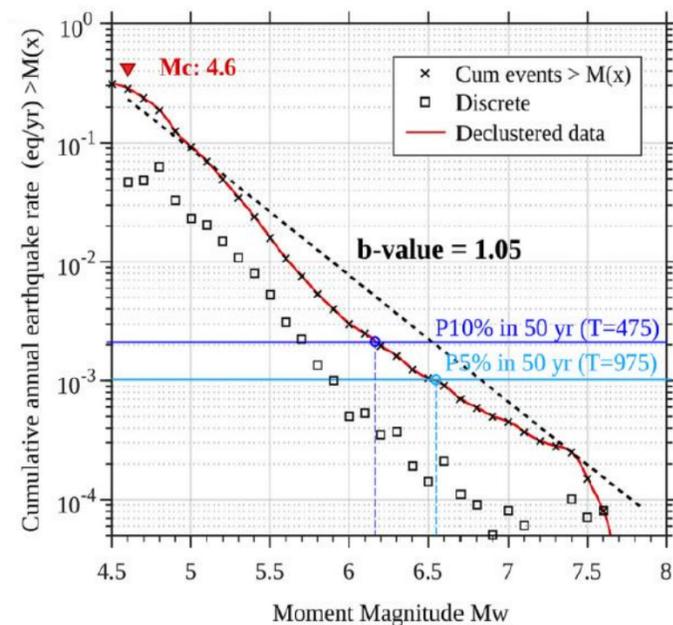

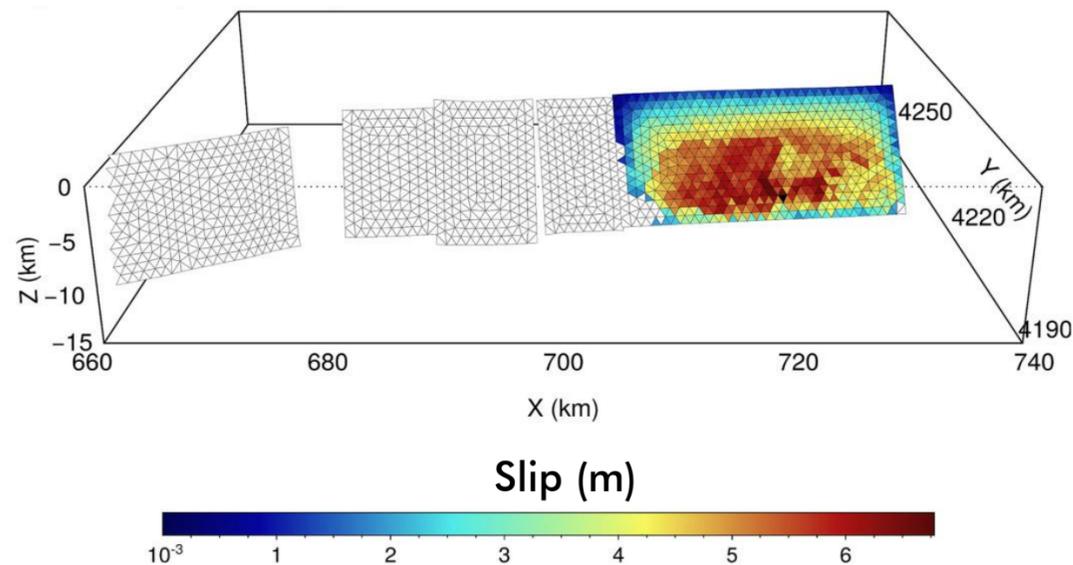

My research interests include kinematic and deformation analysis of earthquake-related geological processes in active seismotectonic regions. My multidisciplinary approach includes structural geology, 3D numerical modeling, data analysis, and computer science applied to the study of active seismotectonic areas

”

ROLE IN DEFENS

Post-Doc Researcher in Structural Geology and Numerical Modeling

Herrero-Barbero et al., 2023

Modeling the seismogenic sources

Identify and model the potentially seismogenic sources of extensional fault systems through the use of numerical modeling software.

Replication of the seismic cycle

Seismic simulators are capable of replicating rheological conditions and tectonic stresses in order to reproduce dynamic seismic cycles and coseismic ruptures over very long time periods.

Analysis of the role of earthquake gates

It is important to analyze the role of structural complexities of fault systems and their three-dimensional geometries in order to understand the actual seismic potential of seismogenic sources.

Interpretation and validation of models

The simulation results will be compared with seismological, historical, and paleoseismological data to validate the models that best represent reality and to provide more accurate tools for assessing seismic hazard in our country.

“

Maria Grazia focuses on alkaline and peralkaline environments integrating mineralogical, petrographic and geochemical analysis. I mainly investigate mineralogy and geochemistry of complex phases enriched in Rare Earth Elements. I also focus on the behavior of Rare Earth Elements in active tectonic settings

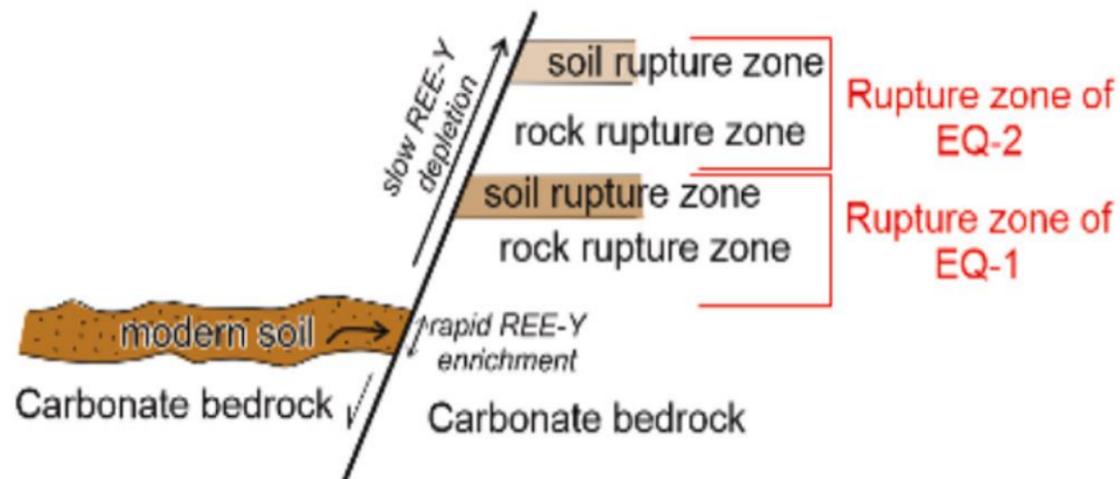

”

ROLE IN DEFENS

Post-Doc Researcher in Geochemistry and Petrology

Bello et al., 2023

Moraetis et al., 2023

Quantify soil-fault contribution to REE-Y enrichment

Measure and model the quantitative contribution of surrounding soils to REE-Y enrichment on carbonate fault scarps, investigating how soil pH, mineralogy, and organic matter influence REE-Y speciation, fixation, and mobility at the soil-carbonate interface.

Evaluate REE-Y levels as proxies for seismic cycles

Characterize successive enrichment/depletion levels along fault scarps to determine their reliability for reconstructing past seismic activity and calibrating temporal enrichment/depletion patterns.

Experimental data and thermodynamic modeling

Combine laboratory experiments with thermodynamic simulations to improve the understanding and predictive modeling of REE-Y mobility during seismic cycles.

Geochemical database development

Development of a comprehensive geochemical database integrating paleoseismological data, ^{36}Cl exposure ages, tephra geochemical analyses, radiocarbon dating, and $^{40}\text{Ar}/^{39}\text{Ar}$ chronologies for seismic history reconstruction.

**DEFENS – 3D gEology-constrained seismic rupture dynamic models:
a new interdisciplinary strategy For Earthquake forecastiNg and reSilience**

ONGOING ACTIVITES

Sampling strategy

ONGOING ACTIVITES

Sample preparation for ICP-MS analysis

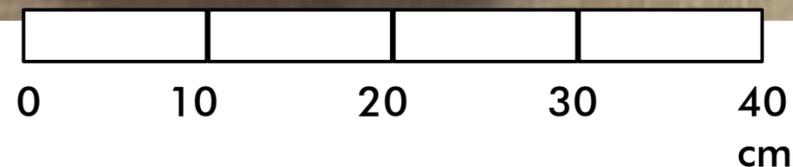

FROM

THROUGH

TO

Washing of the sample with 5 mL H_2O_2 (130 vol.)

Mechanical removal of ~2 mm of surface patina

Collection of ≥ 0.03 g of material

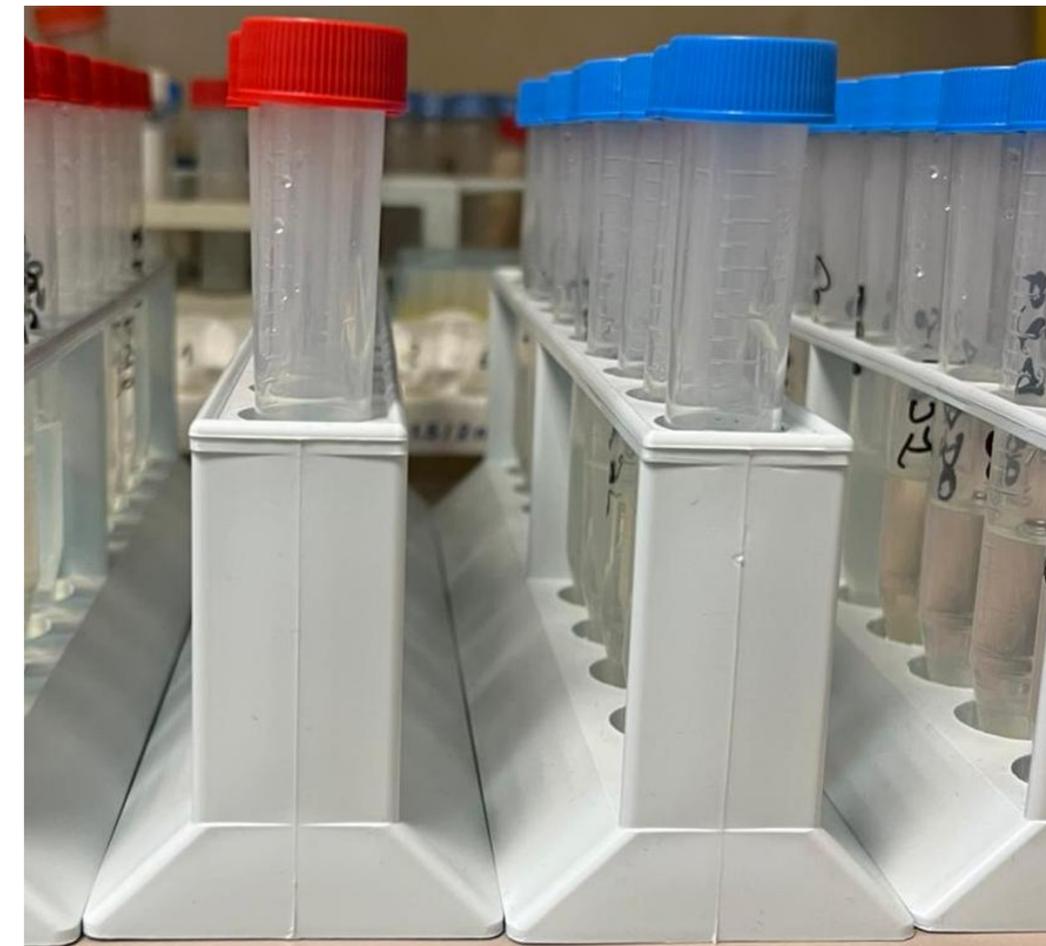

Second washing with 5 mL H_2O_2 (130 vol.)

Drying at 80 °C until complete dryness

Digestion with 10 mL HCl 2 N

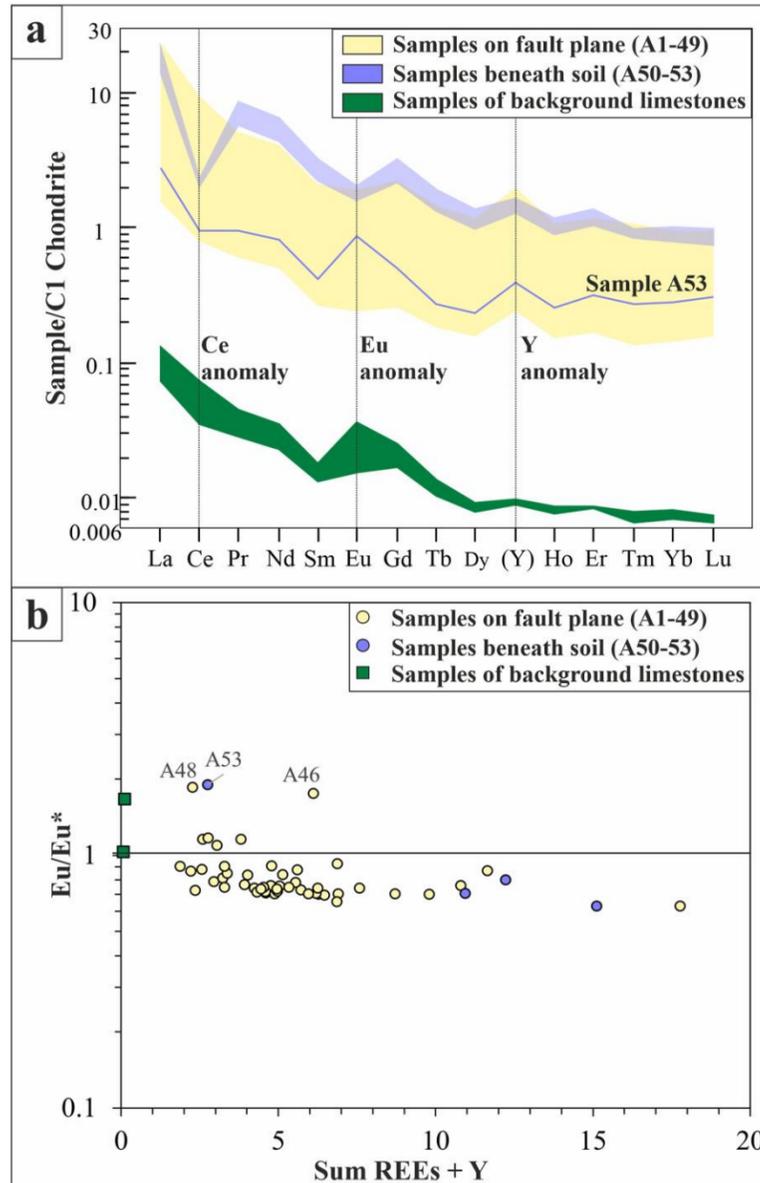

Drying at 105 °C until complete dryness

Second digestion with HNO_3 diluted 1:10 with distilled H_2O

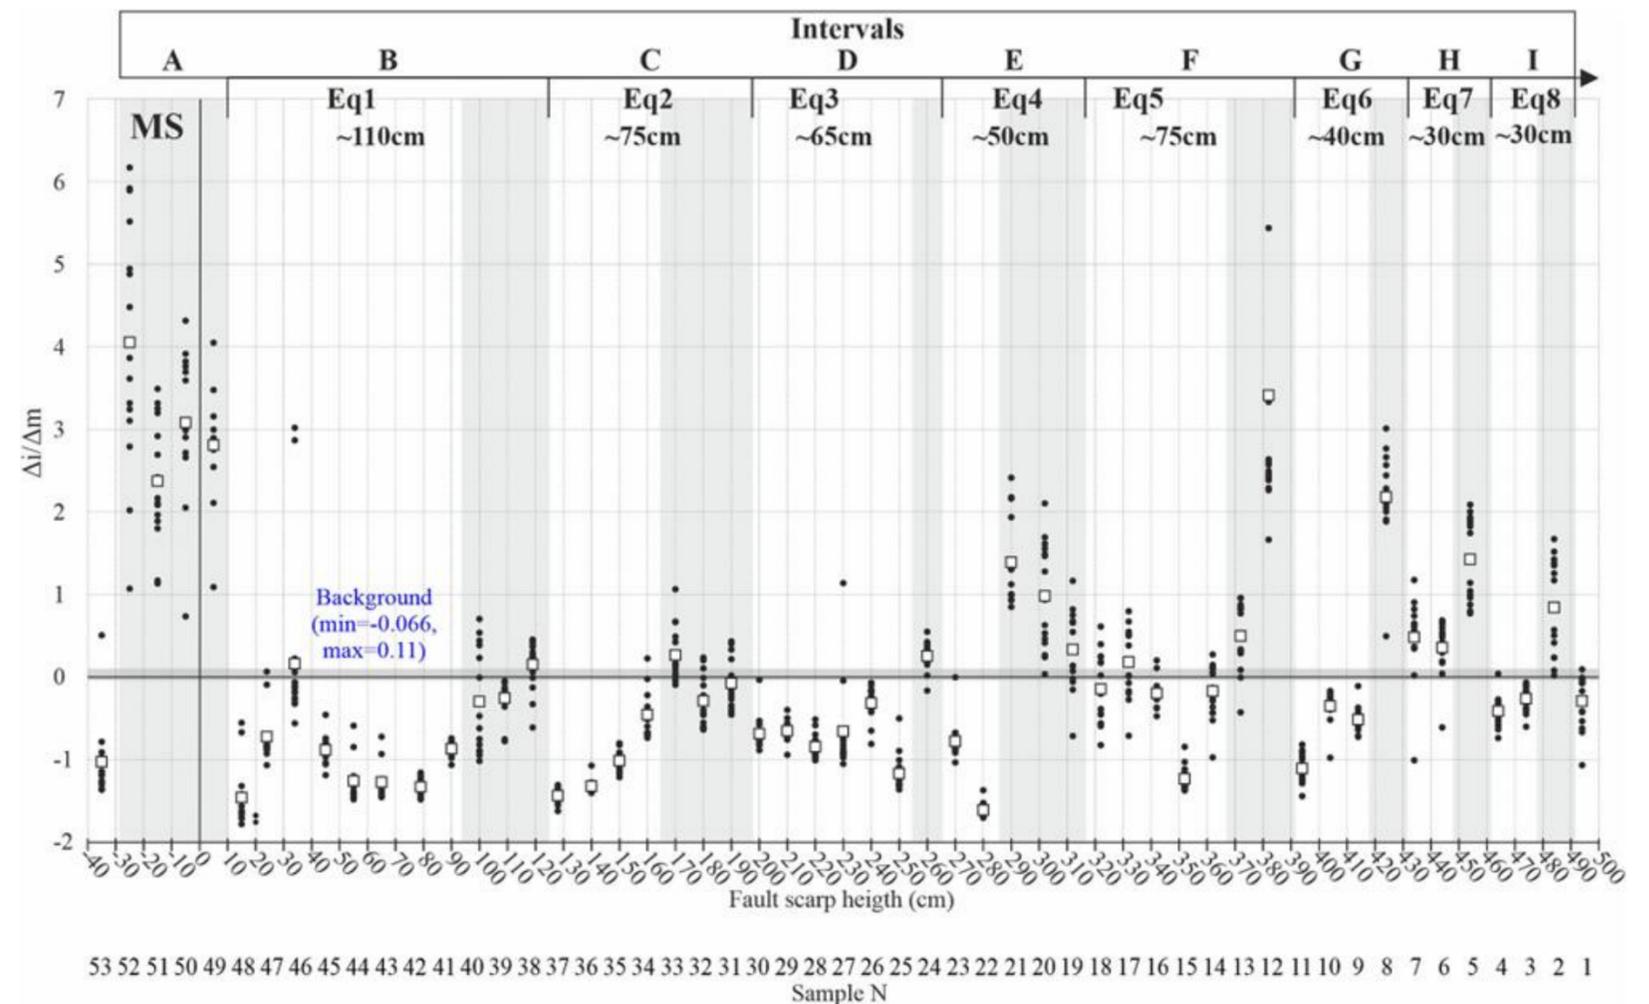

ONGOING ACTIVITES

ICP-MS analysis results

(a) Pattern of Rare Earth Elements (REE) + Y (REE + Y) for the LIM bedrock and fault carbonates samples.
(b) Total REE + Y (Σ REE + Y) compared to the Eu/Eu* ratios of the samples analyzed.

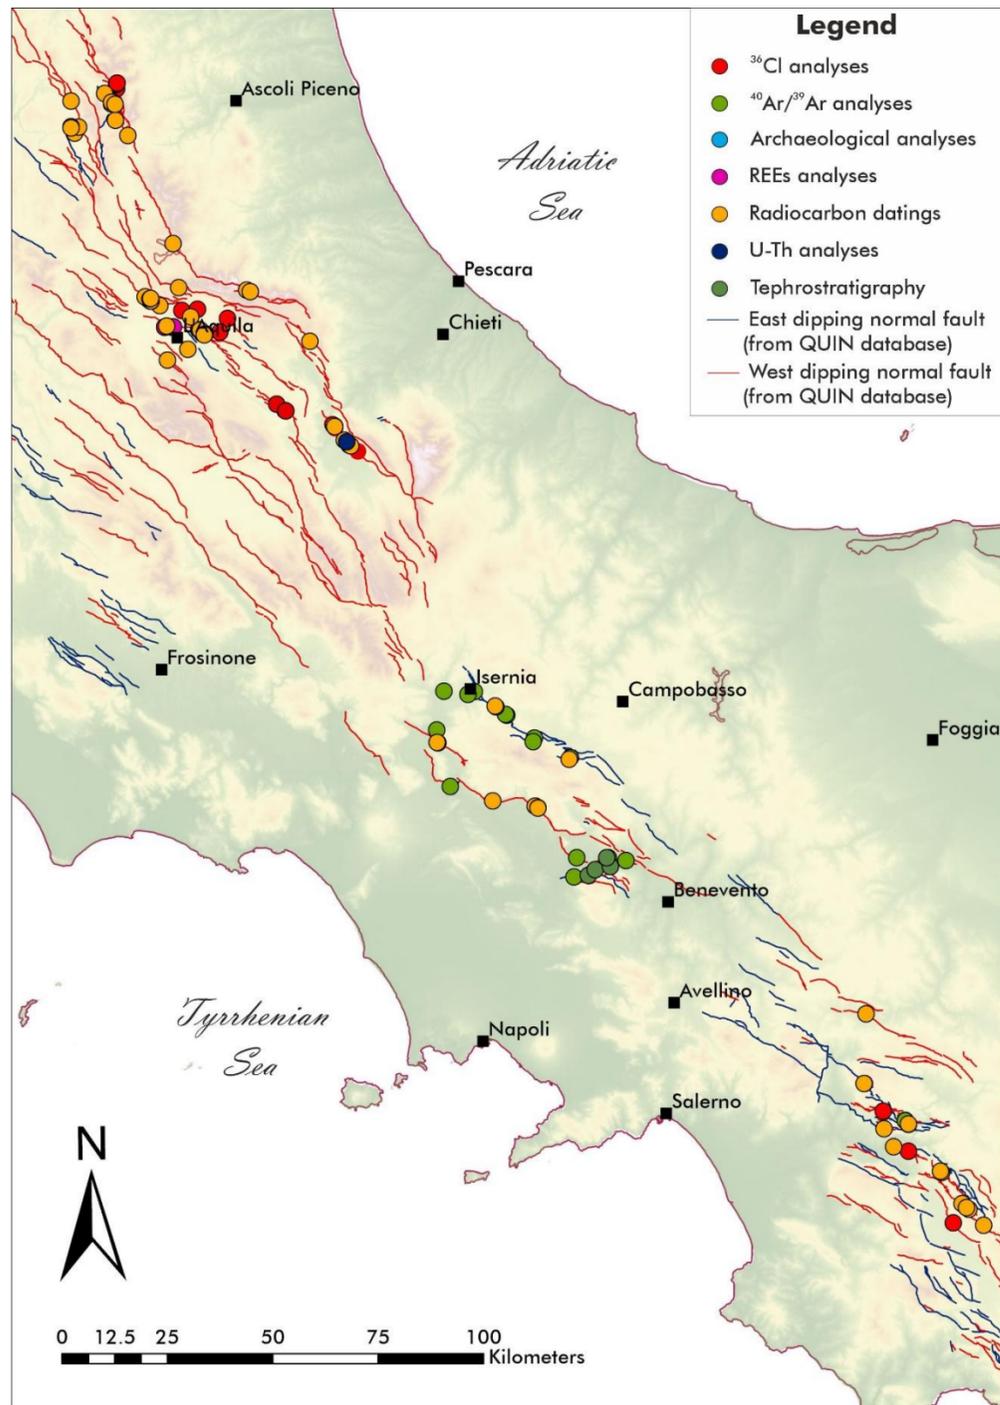

Variability of rare earth elements + Y (REE-Y) content in our limestone sample cores along the fault scarp height (cm).

DEFENS – 3D gEology-constrained seismic rupture dynamic models: a new interdisciplinary strategy For Earthquake forecastiNg and reSilience

ONGOING ACTIVITES

Geochemical – paleoseismological database construction

“

My research interests focus on the kinematic and deformation analysis of geological processes across different crustal levels in active seismotectonic regions and fossil systems (e.g., the Alps, the Apennines, and the Makran) responsible for mountain building events. My multidisciplinary approach includes structural geology, field mapping, micro- and nano-analytical techniques, and thermodynamic modelling

”

ROLE IN DEFENS

Post-Doc Researcher in Structural Geology and Tectonics

Fieldwork

Field mapping and structural analysis of main fault systems targeted by DEFENS.

High-Resolution Topography

High-Resolution Topography, photogrammetry-derived DEM and Lidar acquisition through Airborne, and topographic profile analysis.

Textural analysis of fault rocks

High-resolution microtextural analysis of fault rocks through Electron Back-Scattered Diffraction (EBSD) techniques for elucidating the aseismic-seismic transition during crustal deformation.

Database Development

Development and implementation of geological databases with structural-geometrical and topographic data got through DEFENS.

DEFENS – 3D gEology-constrained seismic rupture dynamic models: a new interdisciplinary strategy For Earthquake forecastiNg and reSilience

ONGOING ACTIVITES

Field activities management

Bibliographic review for:

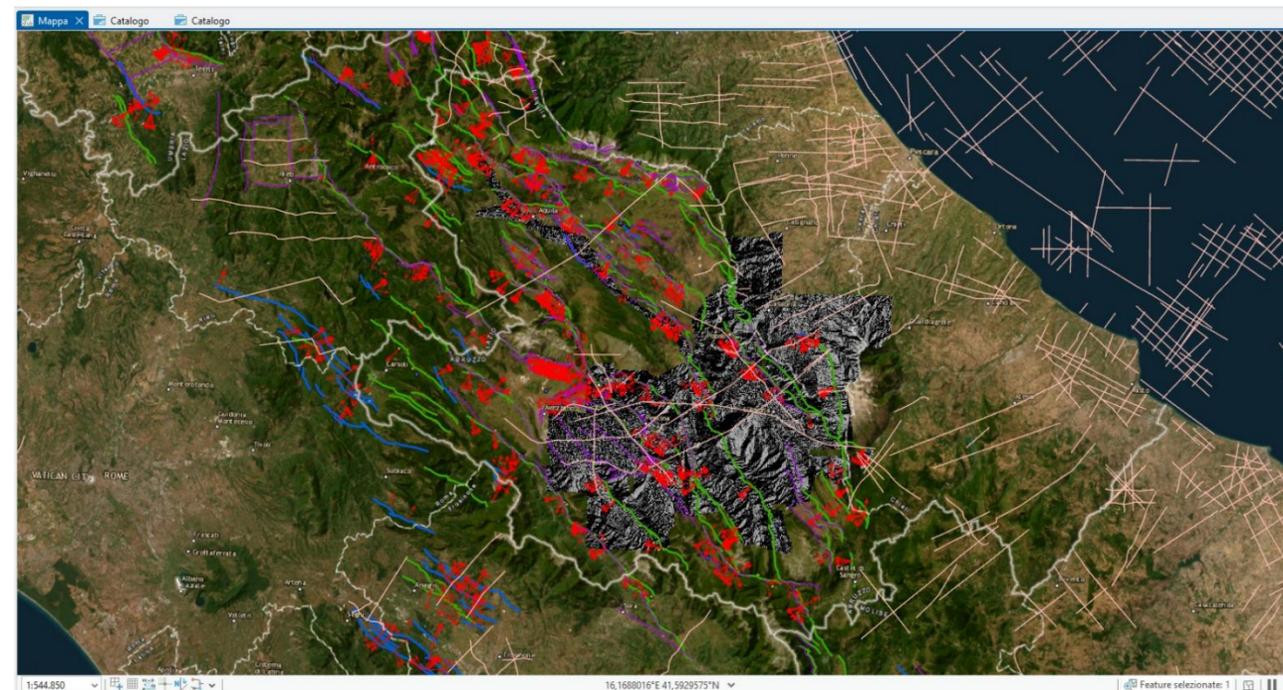

- Campaigns planning 
- Trenches planning 
- LIDAR acquisition by AirBorne 

Structural mapping and sample collection

- Classic fieldwork
- Structural data collection
- Sample collection for EBSD analysis

Structural and topographic data storage in a GIS database

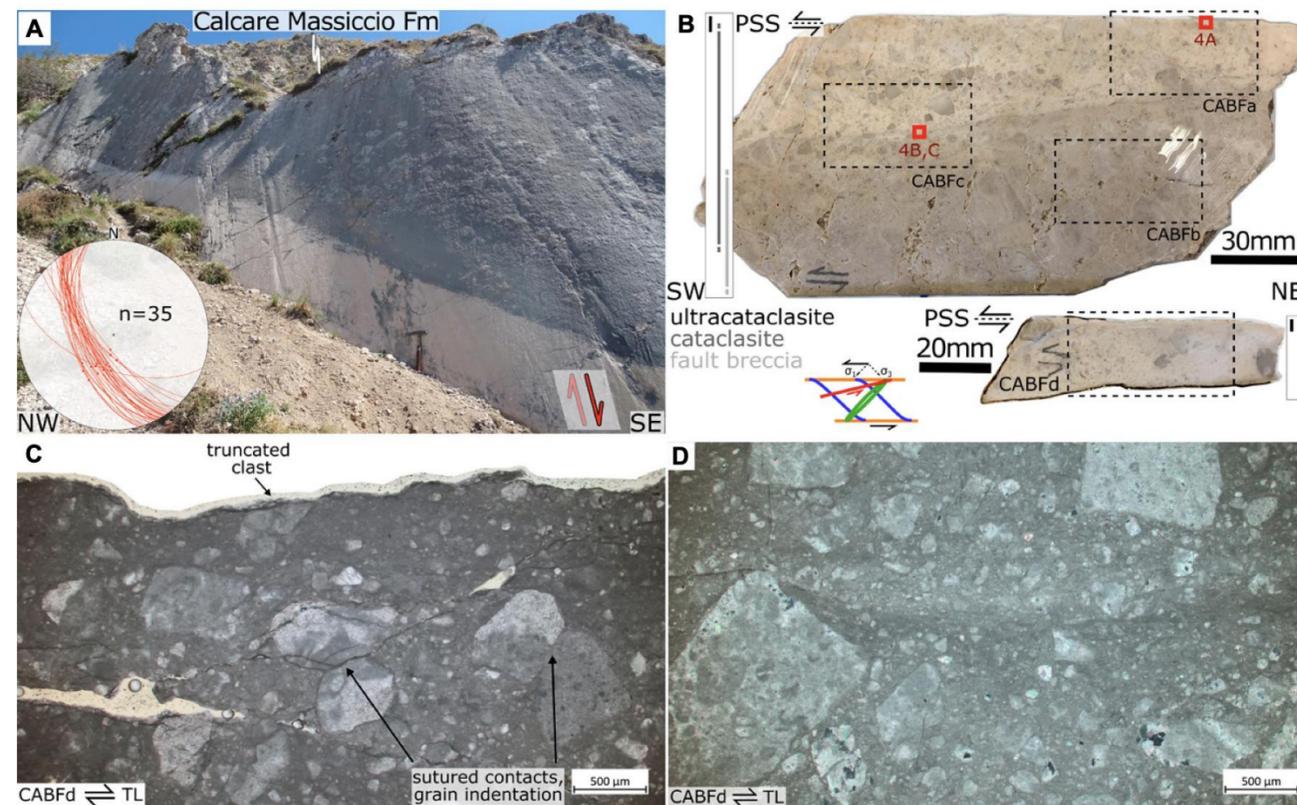

DEFENS – 3D gEology-constrained seismic rupture dynamic models: a new interdisciplinary strategy For Earthquake forecastiNg and reSilience

ONGOING ACTIVITES

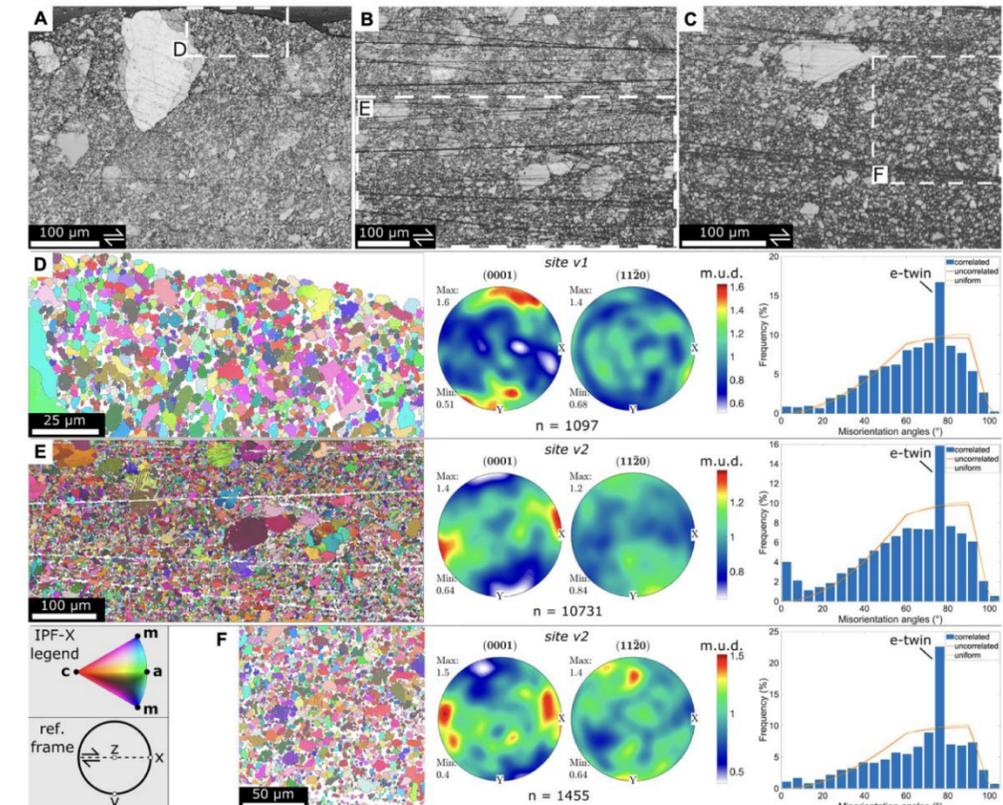

EBSD analysis

Example from **Mt. Vettore Fault**

Investigate microscale mechanisms controlling deformation along active fault system

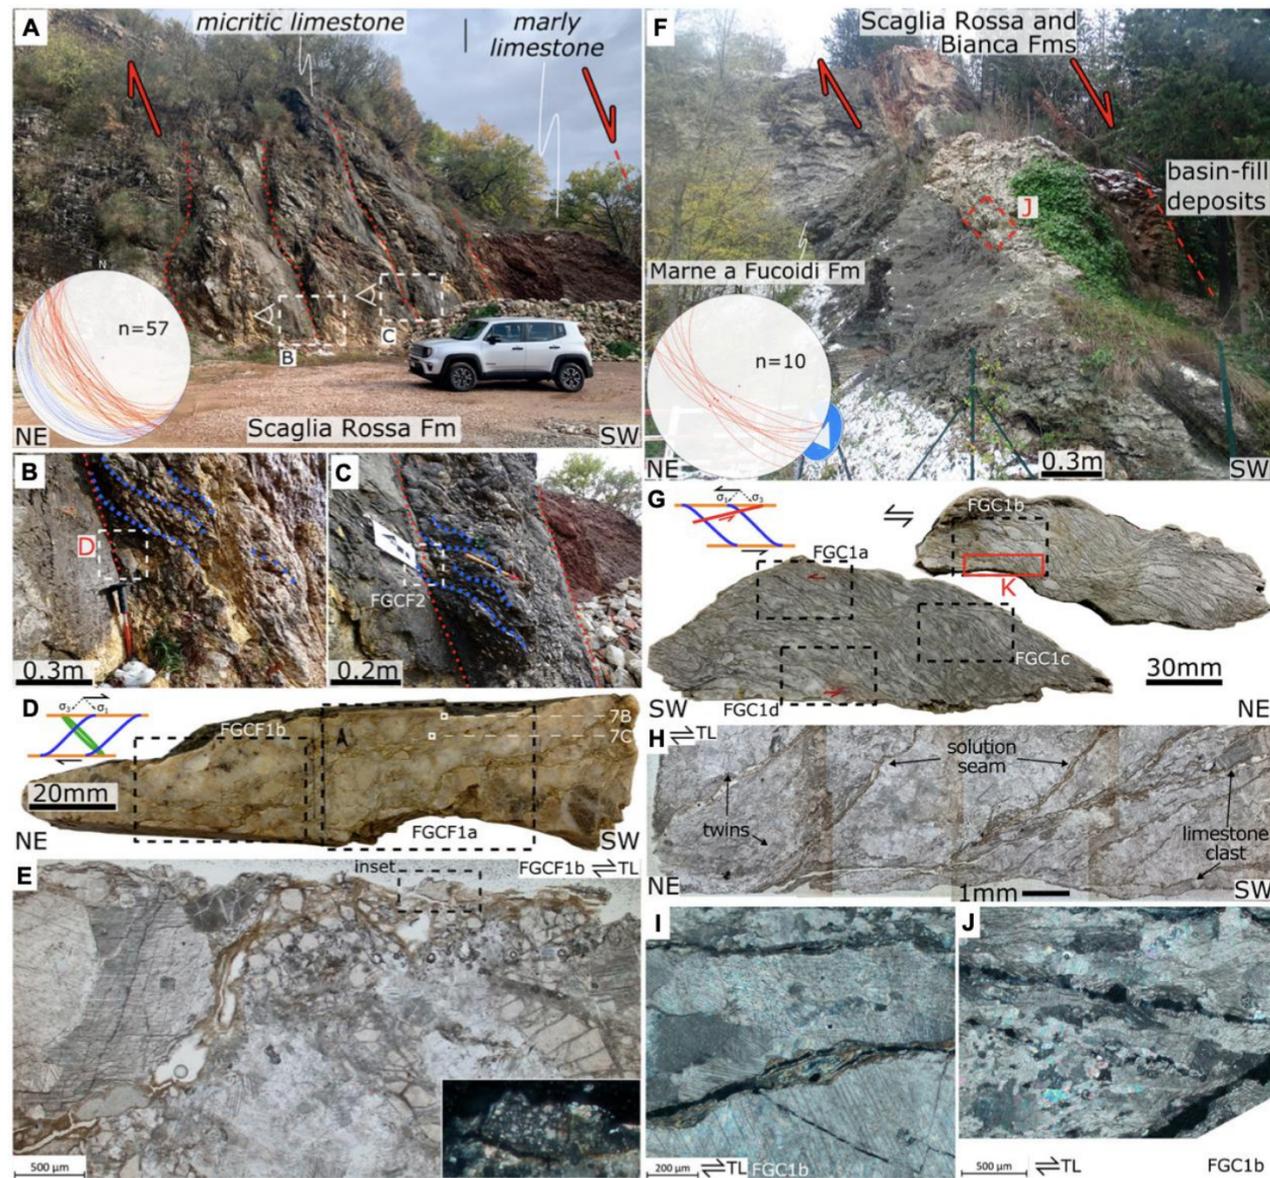

Del Sole et al., 2024

Del Sole et al., 2024

ONGOING ACTIVITES

EBSD analysis

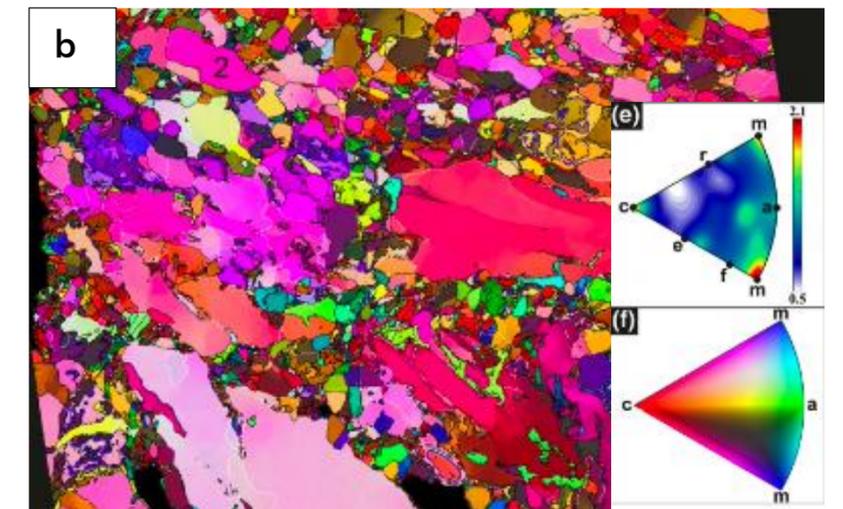

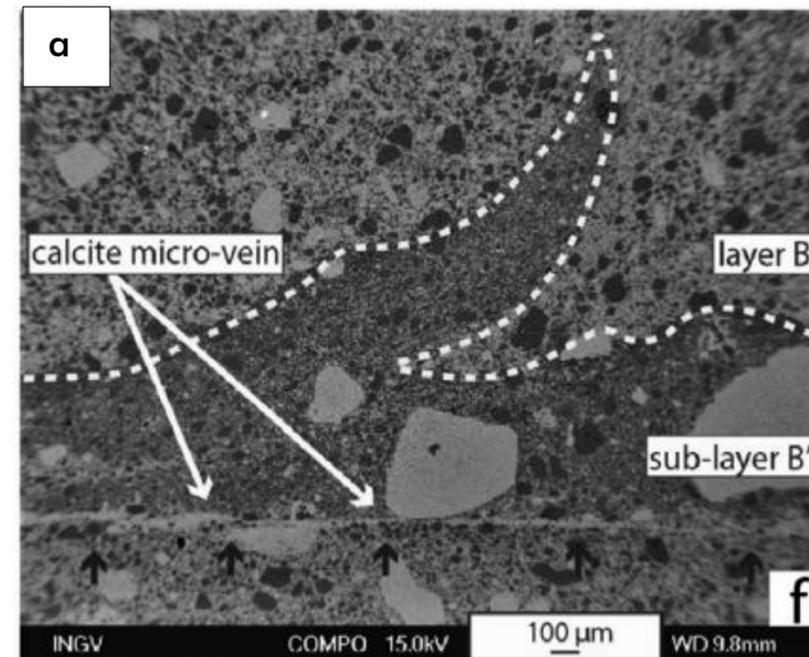

Del Sole et al., 2024

Example from **Gubbio Fault**

Investigate microscale mechanisms controlling deformation along active fault system

Different deformation mechanisms may coexist simultaneously in different domains of a fault. Understanding which mechanisms promote or inhibit future ruptures and fault propagation in space and time is fundamental

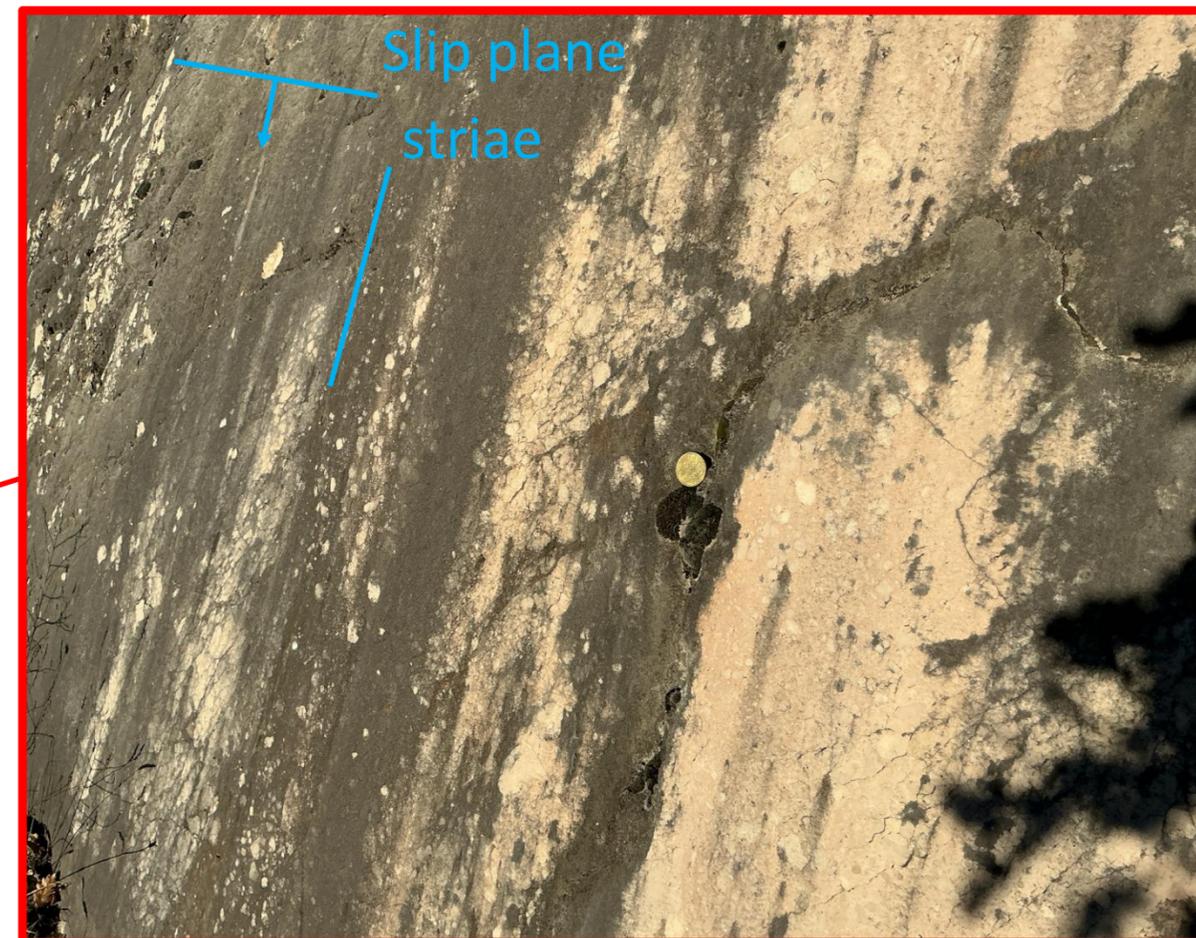

Ohl et al., 2019

ONGOING ACTIVITES

EBSD analysis

Samples from **Roccapreturo Fault System** (Middle Aterno Valley, Central Apeninnes)

Investigate microscale mechanisms controlling deformation along active fault system

DEFENS – 3D gEology-constrained seismic rupture dynamic models: a new interdisciplinary strategy For Earthquake forecastiNg and reSilience

MICHAEL GUY MARSHALL – M.Sc.

Now

Ph.D. Student in Structural Geology
Geosciences
"G. d'Annunzio" University of Chieti – Pescara

2022-2025

Geology Master Student
RaMES
Alma Mater Studiorum - University of Bologna

ERASMUS
"NTNU" in Trondheim, Norway

Internship abroad with "Metamorphic A.S."
Norway

2018-2021

Bachelor degree
Geological Sciences
Alma Mater Studiorum - University of Bologna

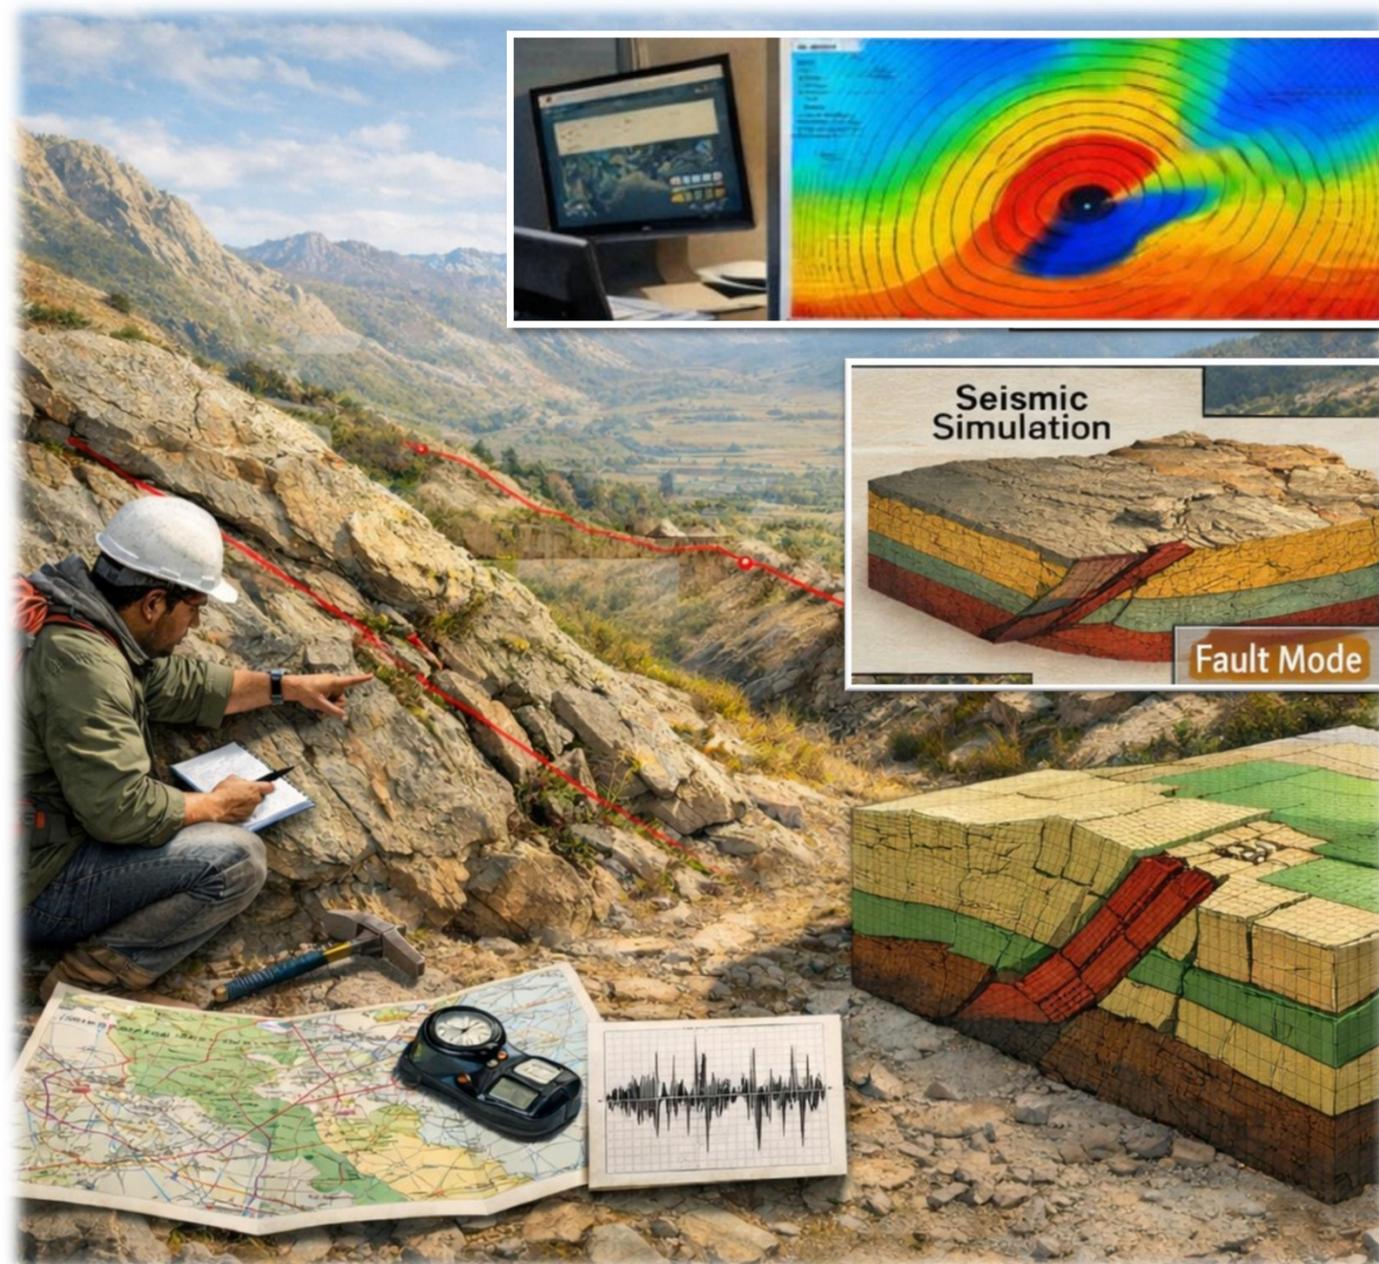

“

Geologically constrained 3D modeling of subsurface geometries is my personal passion and was the backbone for my thesis. Incorporating these with physically backed dynamic models will be the basis for my PhD project. I hope to learn these state-of-the-art parameter collecting strategies from my team and apply them accordingly

”

DEFENS – 3D gEology-constrained seismic rupture dynamic models: a new interdisciplinary strategy For Earthquake forecastiNg and reSilience

ROLE IN DEFENS Structural Geology Ph.D. Student

Collect structural field data

Collecting data in the field is the first step. Data is intended as both classic «compass and hammer» structural data and high-resolution LIDAR imaging. The data will be meticulously treated with the highest standards.

Develop 3D models

The field data will be used alongside a thorough state of the art literature study session as input to the modeling phases. An important milestone will be the development of high-resolution topographic 3D models of selected areas along the Apennines.

4D Dynamic rupture models

Once a strong backbone has been achieved, the time dimension can be added to fault models, obtaining an archive of time constrained seismic events. These will be used to check the model's reliability and (if determined reliable) even forecast future seismic events.

Disseminate scientific knowledge

The publishing of relevant scientific articles in these three years will be impactful and will aim to spread evidence backed scientific knowledge about the seismic hazards looming below the Apennines.

ONGOING ACTIVITES

Currently working on... getting settled in.

I have just started working alongside the team with:

- Catching up as fast as I can (completed ArcGis Pro Course)
- Reading literature about the project's study areas
 - Selecting (undisclosed) area of interest.
 - Learning the team's methods and goals.
- Studying dynamic rupture simulation software.
- Verifying possible machine learning applications.
- Understanding university policies, politics, practices, forms, website, etc...

CAMILLO DE NOVELLIS

“

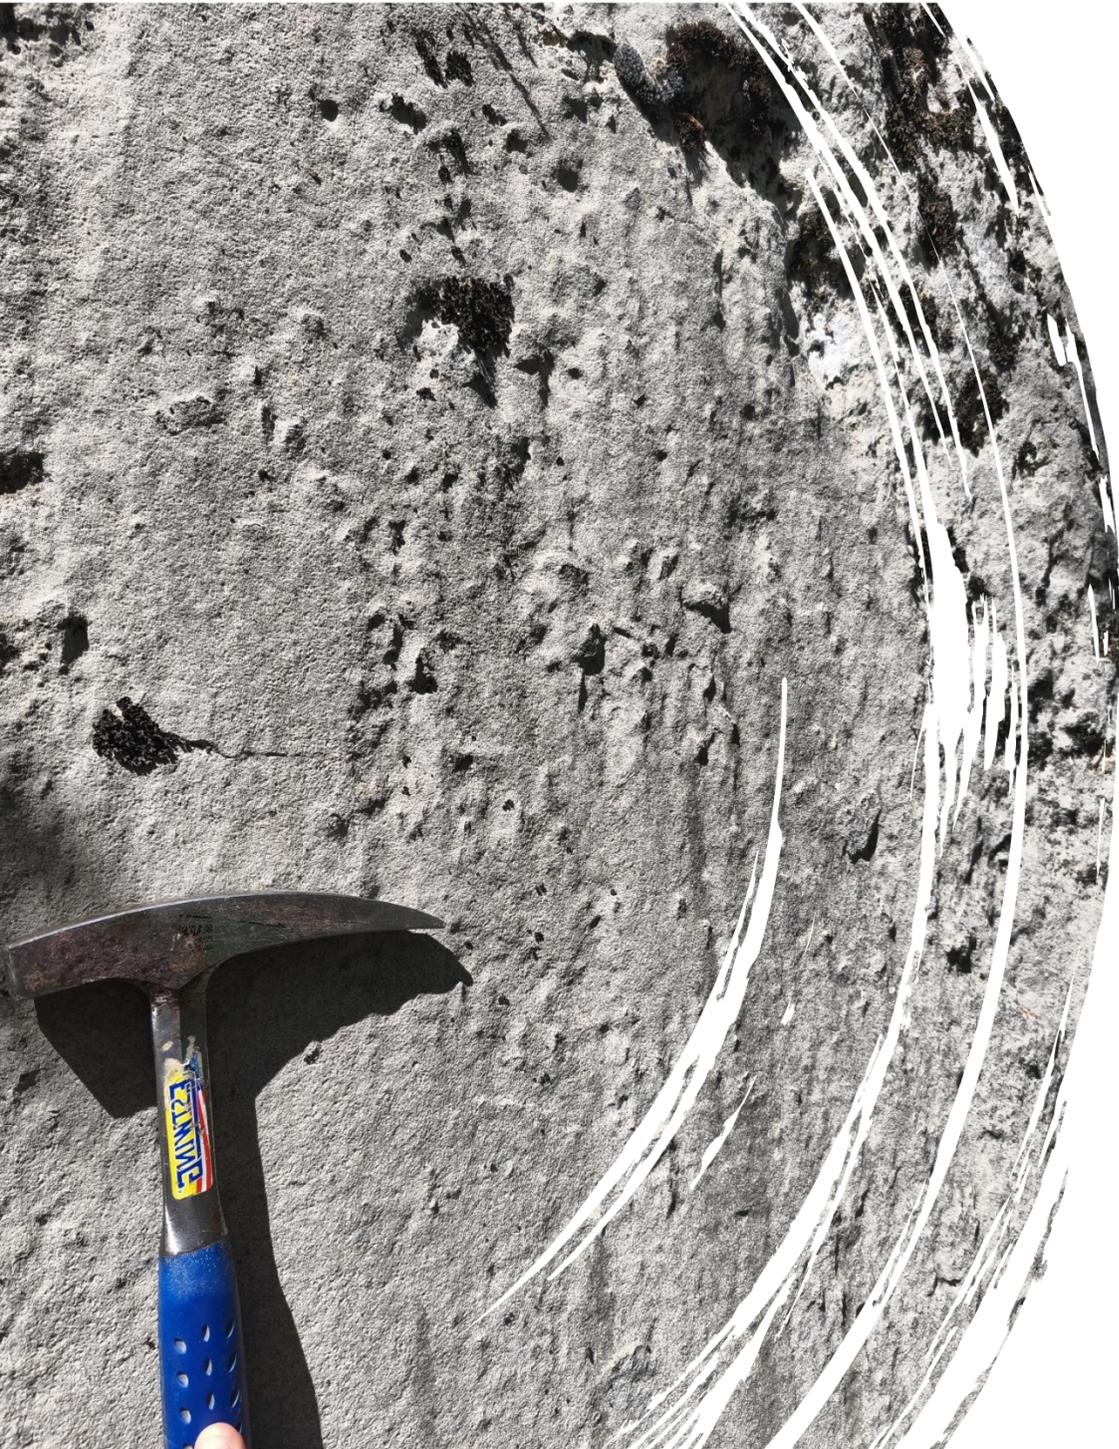

Geological and structural mapping of fault systems to understand their kinematic evolution and deformation history.

Identification, characterization, and spatial analysis of fault geometries, slip indicators, and structural relationships, in order to constrain the mechanisms of fault activity.

”

ROLE IN DEFENS

Scholarship Fellow

Geological survey

Structural field survey activity for a systematic and georeferenced collection of geological and structural-geological data necessary to characterize the long-term surface deformation.

Geological-structural data management

Development of conceptual and thematic structural-geological maps and datasets.

Structural analysis

Analysis and integration of acquired structural data to identify the main deformation patterns and the geometric and kinematic relationships between structures.

Interpretation

Interpretation of the results within the regional structural and geodynamic framework, to support the evolutionary reconstruction of the study area.

DEFENS – 3D gEology-constrained seismic rupture dynamic models: a new interdisciplinary strategy For Earthquake forecastiNg and reSilience

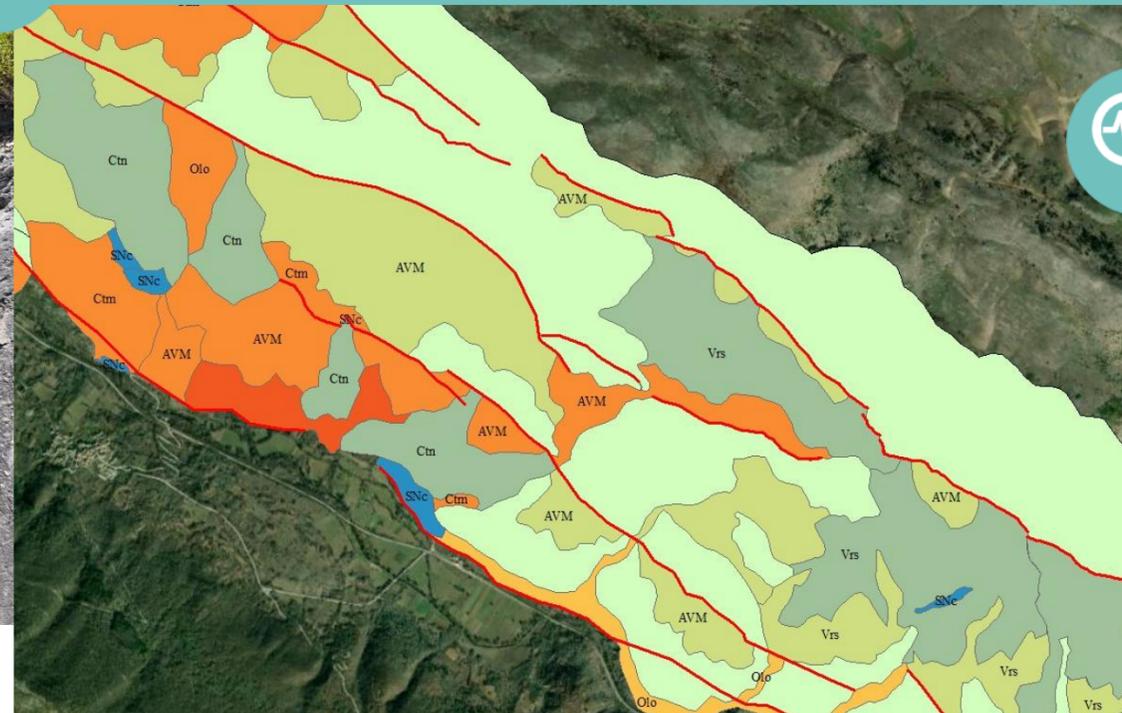

ONGOING TO ACTIVITIES

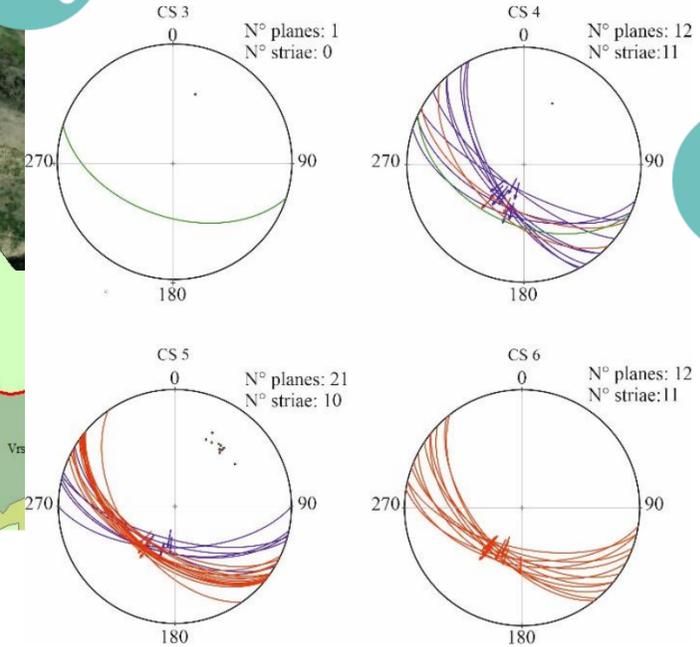

Geological survey

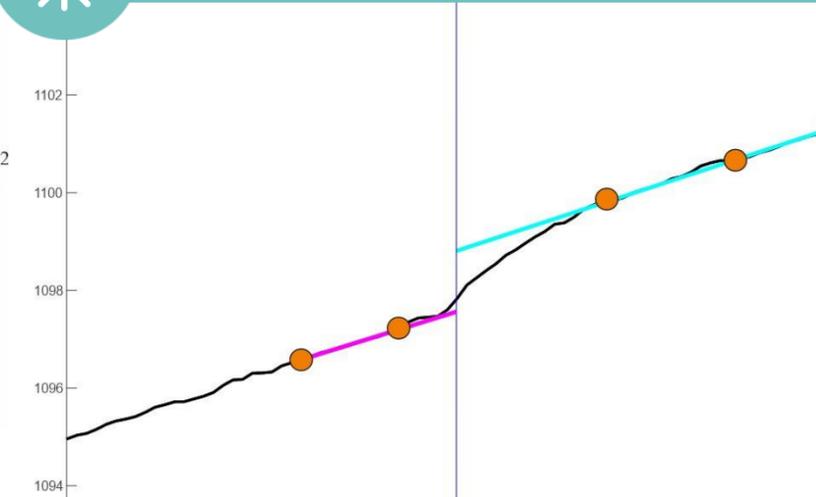

Geological – structural data management

Structural analysis

Interpretation

All this will be in my upcoming master's thesis!

**DEFENS – 3D gEology-constrained seismic rupture dynamic models:
a new interdisciplinary strategy For Earthquake forecastiNg and reSilience**
